Installation Instructions for **besgo** VALVES

Installation of the automatic backwash system

All connections to the automatic backwash system can be glued outside (slip connections). The connections leading to the automatic backwash valve should be made using threaded connections or flanges (breakable couplings) and must be installed free from any tension.

Connections:

- A** Filter connection: top
- B** Filter connection: bottom
- C** Connection to filter pump
- D** Connection to backwash pipe
- E** Connection to return water pipe to pool

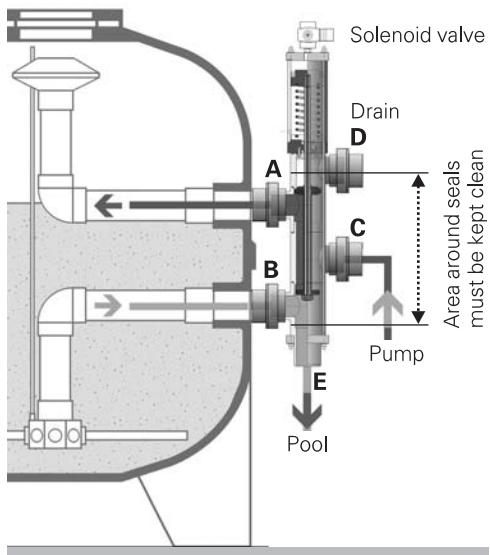

Maximum operating pressure 3.5 bar

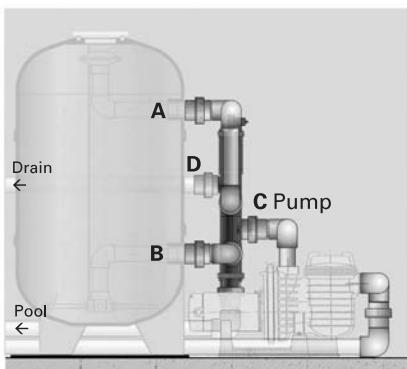

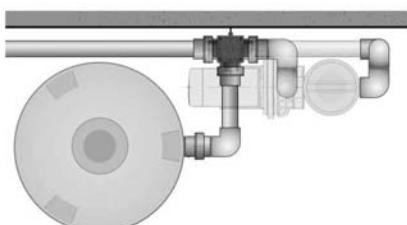

Please ensure that no adhesive gets inside the automatic backwash valve during installation. Incorrect installation can force the piston rod to jam and cause the valve to leak.

Fitting to the filter

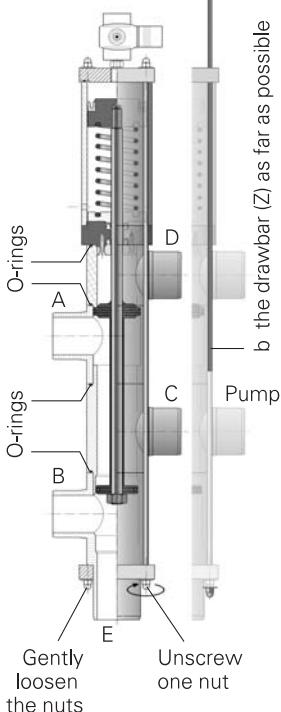

for DN40 / DN50 / DN65

Mounting besgo on the Wall

Besgo valves (DN65 / DN80 / DN100) should be attached to the wall on site using pipe clamps.

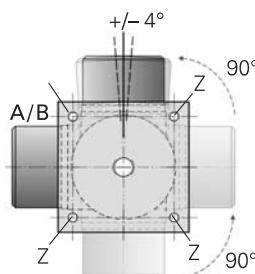

Changing the direction of connections C and D

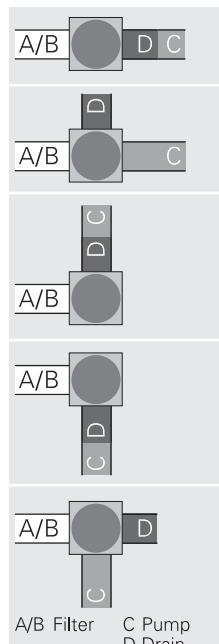

If the pipe work is not parallel to the unit, the connection unions **C** and **D** can be rotated through 90 degrees. Additionally a fine adjustment of $\pm 4^\circ$ is possible. This guarantees an installation free from any tension.

This is done as follows:

- a gently loosen the cap nuts on the four drawbars (Z).
- b unscrew one nut and lift the drawbar as high as possible.
- c rotate the corresponding connection pipe. **Attention!** Always remove only one drawbar. Replace drawbar and tighten nut gently. If necessary, adjust another drawbar and continue as stated above.
- d Fasten nut gently with a screwdriver, tightening diagonally, until any gap between both T-pieces disappears. Tighten nuts uniformly and ensure that the O-rings will not be jammed.

Possible Positions

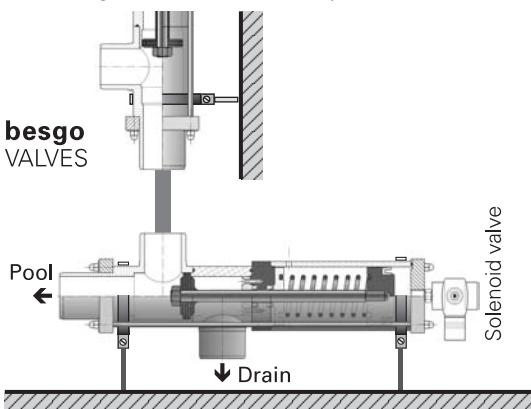

besgo
VALVES
– SIMPLE
– SAFE

Installation of the three way valve

Rinsing with additional 3-way valve

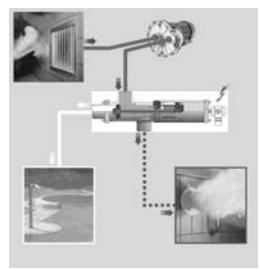

Energy saving

2 from main drain
4 pump
5 buffer tank
6 besgo 3-way valve
8 drain

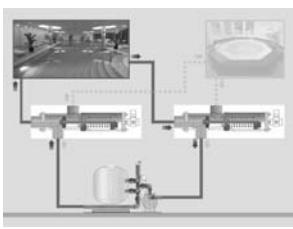

Switching between two water features

Switch over without switching off!

Switching between pool and whirlpool

In order for the valves to close at the same speed, we recommend operation with compressed air

Connection of the Solenoid Valve

besgo VALVES are pneumatic valves. They can be operated with water or air pressure.

The operating pressure should lie between 3.5 - 6.0 bar.

Operation with water pressure (with pressure line PL, on site):

If the pressure of the water supply (mains pressure) is high enough, this pressure is totally suitable as the motive power needed to operate the valve. We recommend the **installation of a pre-filter** to protect the solenoid valve against dirt. A dirty solenoid valve can become blocked and this can lead to a malfunction.

If other devices (e.g. level controller) are connected to the same water circuit, a non-return valve must be fitted. When closing the valve, the water, which flows out from connection R1, can be channeled into the drain by means of a suitable tube. Please observe the regulations of your local water authority.

Operation with air pressure:

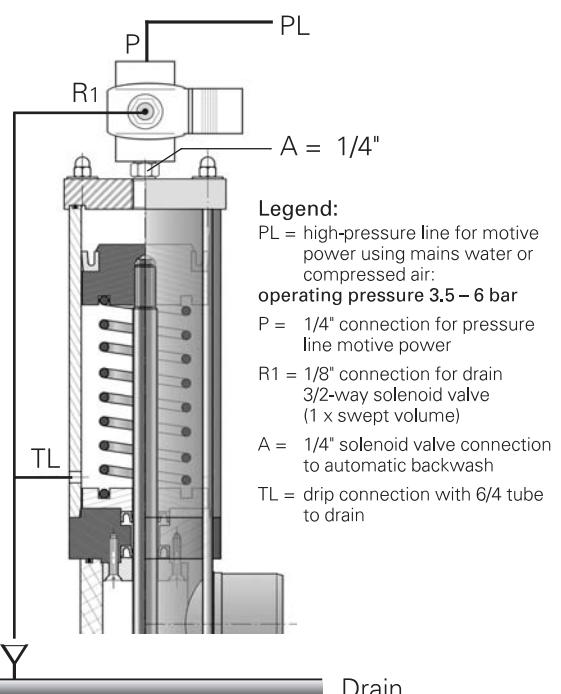

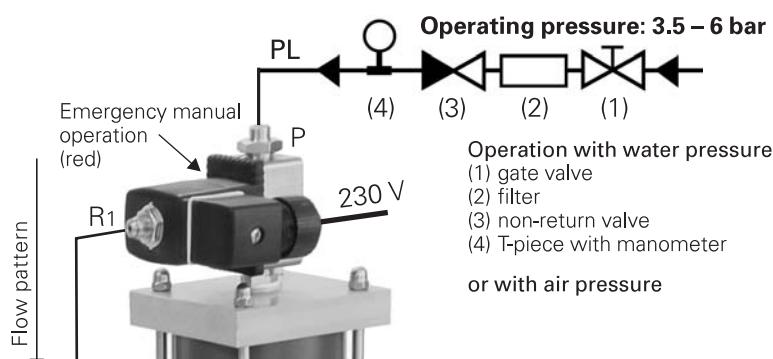

If the water pressure is too low, we recommend operation of the valves with air pressure. Small economical air compressors with tanks (min. 20 litre) are suitable. The valves operate considerably faster with air pressure than with water pressure.

Tip: The operation of the compressor can be limited to daytime hours by means of a time clock.

Installation: DN40/d50, DN50/d63, DN65/d75, DN80/d90, DN100/d110

Included is a 3/2-way solenoid valve (230 V) with emergency manual operation and 2 x 1/4" connections and 1 x 1/8" connection.

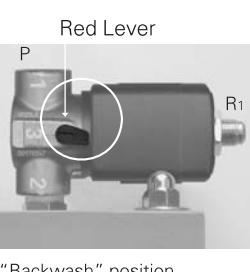

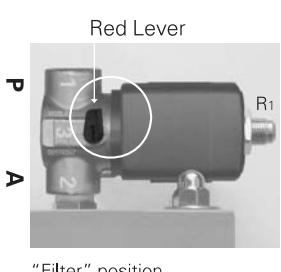

Emergency manual operation

(for use by qualified service personnel only)

This is used for checking the correct operation of the besgo. Manual operation will trigger backwashing without automatic control. To initiate manual backwashing, turn the red lever 90 degrees clockwise.

The red lever must be placed in the «Filter» position after backwashing, otherwise the pool will be emptied.

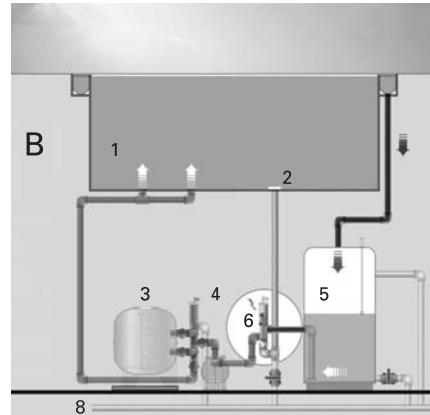

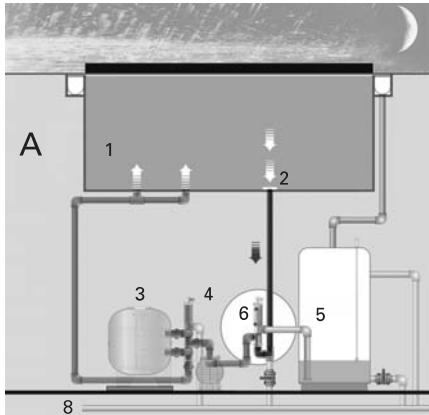

Energie und Kosten sparen mit besgo 3-Wege-Ventil

■ Sparschaltung

Legende:
 1 Schwimmbad
 2 Bodenablauf
 3 Filter
 4 Pumpe
 5 Schwallwasserbehälter
 6 besgo 3-Wege-Ventil
 7 Magnetventil (Ohne Strom – Sparschaltung)
 8 Kanal

Nur für Schwimmbecken mit Überlaufrinne

- A** Sparschaltung Umwälzung über Bodenablauf
B Normalschaltung Umwälzung über Rinne

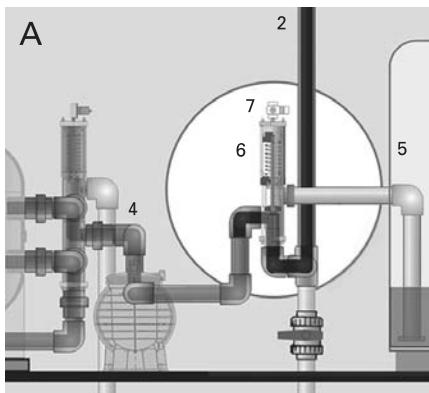

Économiser de l'énergie et des coûts grâce à la vanne à trois voies besgo

■ Circuit économiseur

Legende :
 1 piscine 5 réservoir d'eau refoulée
 2 siphon 6 vanne à trois voies besgo
 3 filtre 7 vanne magnétique (sans courant, circuit économiseur)
 4 pompe 8 égout

Uniquement pour piscines pourvues de goulotte de débordement

- A** Circuit économiseur
 Circulation à travers le siphon
B Commutation normale
 Circulation à travers la gouttolette

Verlangen Sie den
as report
 «Energie sparen».

Risparmio d'energia e di costi con valvole a 3 vie besgo

■ Comutazione di risparmio

Leggenda:
 1 piscina 5 vasca di compenso
 2 scarico di fondo 6 valvola a 3 vie besgo
 3 filtro 7 valvola magnetica (senza corrente di risparmio)
 4 pompa 8 canalizzazione

Soltanto per piscine a sfioro

- A** Comutazione di risparmio tramite scarico
B Comutazione normale tramite sfioro

Save energy and money with the besgo 3-way valve

■ Energy saving

Legend:
 1 pool 5 buffer tank
 2 main drain 6 besgo 3-way valve
 3 filter 7 solenoid valve (no current necessary during energy saving)
 4 pump 8 drain

Only suitable for overflow pools.

- A** Energy saving (main drain)
B

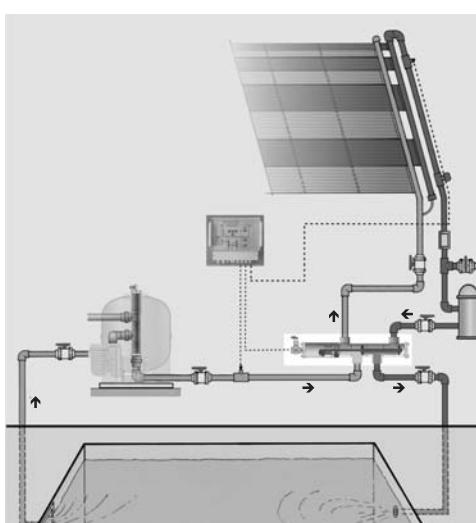

Ahorro energético, y económico con la válvula Besgo de 3-vías

■ Posición modo ahorro

Leyenda :
 1 piscina 5 depósito de compensación
 2 sumidero 6 válvula Besgo de 3-vías
 3 filtro 7 electroválvula (no necesita corriente por modo ahorro)
 4 bomba 8 desagüe

Sólo para piscinas con rebosadero perimetral

- A** Funcionamiento modo "ahorro"
B Funcionamiento a través del rebosadero
